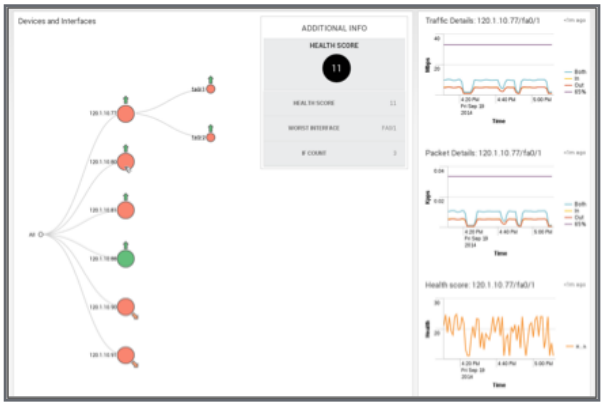
Solution Brief

NetFlow Integrator for Virtual and Physical Network Monitoring

Product Overview

NetFlow Integrator™ is an industry-leading software-only solution for data centers and cloud environments. A significant operational concern for IT Operations and Virtual Network Administrators is the lack of visibility between the virtual and physical networking layers – how to trace and troubleshoot connectivity and performance issues. Lacking traceability leads to longer time to resolution, and unacceptable outage times for customers.



(Interface Health within the NetFlow for Splunk App)

The volumes of network data coming from today's networks are massive and can be overwhelming to IT Operations and Virtual Network Administrators. They need solutions that can leverage existing IT investments to provide fast, actionable insights. By bringing that data into Splunk Enterprise, they can visualize the real time status of network devices, and can correlate their network data with other machine data to gain unique visibility.

NetFlow Integrator provides an easy and scalable way to analyze the massive volumes of network data generated by your routers, switches, next generation firewalls, load balancers (Cisco ASA, F5, Palo Alto Networks, etc.) – whether it is from a physical or virtual network, or both. Monitor your end-to-end infrastructure to avoid service degradation or outages.

Solution Brief

Delivering Network Operational Intelligence for Virtual Administrators

(Virtual and Physical Network Path within the NetFlow for Splunk App)

Gain end-to-end visibility into virtual and physical network traffic paths. See how network conversations traverse the virtual and physical network, including device interface health score, for efficient troubleshooting and planning.

Solution Benefits

- Addresses the top operational concerns for IT Operations and Virtual Network Administration – lack of network topology and visibility into connectivity and performance
- Vastly reduces MTTI (meantime-to-investigation), MTTR (meantime-to-repair)
- Enables and enhances capacity planning, bandwidth monitoring, and performance optimization
- Leverages NetFlow Integrator industry-leading expertise in path trace technologies including IPFIX, NetFlow, and sFlow
- Employs sophisticated patented algorithms to consolidate, correlate and pinpoint critical events
- Reduces training cost and OPEX by having one unified platform

Get up and Running in minutes

NetFlow Integrator software or VM Ready Virtual Appliance installs in minutes. It enables IT Operations and Virtual Network Administrators to find and fix network and application performance, no matter the architecture - traditional, server, and virtualized, or fully virtualized data centers. Download it for deployment in your data center or cloud environment today!
